

Solution Overview

“Internally, Riveon is viewed as the best software tool the company uses. Externally, the return on this investment has been amazing.”

Andy Edleman
Vice President of Marketing M.T.H. Electric Trains

Riveon Extended Enterprise™

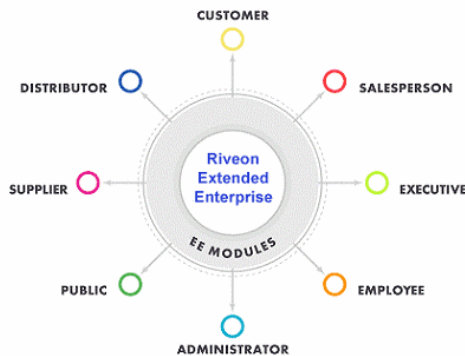

The Solution that Transforms Business – Making Information Available to Anyone, Anywhere, Anytime

Riveon™ makes it easier than ever for companies to connect and interact with all groups who come into contact with the enterprise. Riveon allows customers, employees, partners and suppliers to access, configure, share, and personalize their interaction with enterprise information.

Extends Critical Information Across the Value Chain

Extending critical business information throughout and beyond the enterprise improves business efficiency. Decision-making is improved, traditional paperwork and time-consuming processes are eliminated, and satisfaction is enhanced across the board.

Riveon allows disparate groups to access and share information unique to their individual needs. By accessing relevant information to help with decision-making, the efficiency of the entire value chain is increased.

Picks Up Where Enterprise Systems Leave Off

Riveon helps deliver increased efficiencies by leveraging the investment made in complex enterprise systems.

Enterprise systems are not designed for flexible information sharing to a broad range of casual users. It is time consuming and cumbersome to share data with users beyond a controlled group of highly trained people.

Enterprise systems are installed to streamline internal processes and

procedures. Riveon extends these internal operational efficiencies outward by providing external audiences with flexible, self-service access to valuable information for better decision making.

Riveon enhances the functionality of existing enterprise systems by leveraging existing data infrastructure and securely extending valuable information access to casual users throughout, across and beyond the enterprise.

Synchronizes the Enterprise

Riveon provides access to all enterprise information, including information stored in ERP, CRM, or SFA systems. Even information stored in legacy databases can be made available.

Wired or Wireless Access

Riveon is a full-featured, information sharing solution easily accessed by end-users through the browser on their desktop or wireless device. With Riveon and Wireless Access, the information users need to work efficiently is available to them at any time, regardless of location.

Secure Access to Enterprise Information

Riveon provides security and information protection by allowing each organization to structure and design access control. Organizations decide who gets access to what information according to a hierarchy. Information can be centrally administered across an entire company, or at the department or workgroup level. Users can only access information through the custom-built Riveon business warehouse – not the enterprise data source itself – thereby protecting the integrity and security of the existing data.

Fast and Effective Decision Making

Riveon empowers partners, suppliers, customers, and employees to work smarter and to operate more efficiently by putting all relevant information at the fingertips of those who need it. Immediate access to operational information available when decisions are made ensures higher quality decisions and eliminates costly adjustments. Dealers can directly access inventory levels before placing an order. Customers can check on the status of orders and employees can view and drill into information sorted by division, region or customer.

Personalized Control

Riveon offers a personalized window into the enterprise for each user, based on job function or personal access privileges.

It provides immediate access to eight unique Web sites that are highly configurable to meet the individual needs of end users. Each Web site organizes information into a single, unified view. Having information in one place reduces the number of disparate computer systems, applications, and screens the user otherwise has to use to get the job done.

The Riveon Web interface can be easily customized according to an organization's specific needs and desired "look and feel."

Each individual user can personalize their page with links, saved queries and other pertinent content, providing them a robust access point to the Internet.

Easy to Use

Organizations can't expect the outside world to know or understand their internal enterprise system codes and data format structure. That is why Riveon designed its solution with the express purpose of translating complex, internal data structures into easy-to-understand information for the casual user.

Riveon is powerful in its simplicity so that anyone with a browser and Internet access can quickly begin reaping the benefits of the solution without investing in costly and time-consuming training.

Riveon allows various groups within an enterprise – departments, divisions, and units – and all external groups along the value chain to collaborate through an easy-

to-use Web interface.

Cost-effective and Rapidly Deployable

On average, enterprise systems take at least a year to implement, while Riveon can usually be rapidly deployed in three weeks or less!

Typically, enterprise systems charge on a per-user basis making it cost prohibitive to begin sharing information with additional users. Riveon is licensed on an enterprise basis, removing the financial penalties inherent in increasing the user base.

Implementing Riveon requires minimal hardware and training. Because it is completely browser based there is no client-side software to distribute to end user computers. This simplicity spares organizations the expense of scaling IT infrastructure and resources to allow access by a large pool of users.

Additionally, there is no need for a costly database administrator or other IT personnel to manage or control the application on an ongoing basis. Unlike traditional ERP systems that require full-time IT personnel and database administrators, Riveon does not require a full-time administrator.

Built to Microsoft® Standards

Riveon uses scalable, industry standard technologies and runs on a Microsoft Windows 2000 platform and SQL Server 2000.

A powerful, multi-dimensional data warehouse serves as the foundation for Riveon. This database is uniquely designed to expand and connect back to the core data of the enterprise system -- without jeopardizing the security of the data -- so the value and core capabilities of the enterprise system are fully leveraged.

Because it was built from the ground up using industry standard, Web-based architecture, Riveon is easy to install. It was designed to seamlessly integrate with existing enterprise systems, avoiding the limitations and maintenance costs of other piecemeal or homegrown solutions. Customization is easily accomplished using Notepad and visual dynamic HTML.
